DI TECNOLOGIA

# The YARP middleware

Lorenzo Natale

iCub Facility

Istituto Italiano di Tecnologia, Genova, Italy

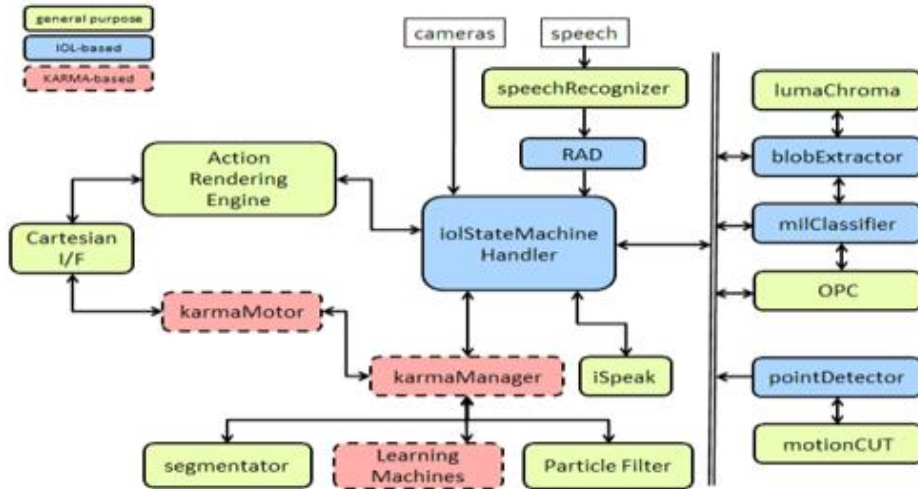

Towards Humanoid Robots OS

Humanoids 2016 Workshop, Cancun, Mexico, 15th November, 2016

*Paikan, A., et al., Enhancing software module reusability using port plug-ins: an experiment with the iCub robot, IROS 2014.*

# System Integration

BILL LEWIS

# Key issues

**Complexity:** distributed processing, heterogeneous systems, noise, real-time

**Asynchronous** development

Variability: various **scenarios** and **platforms**

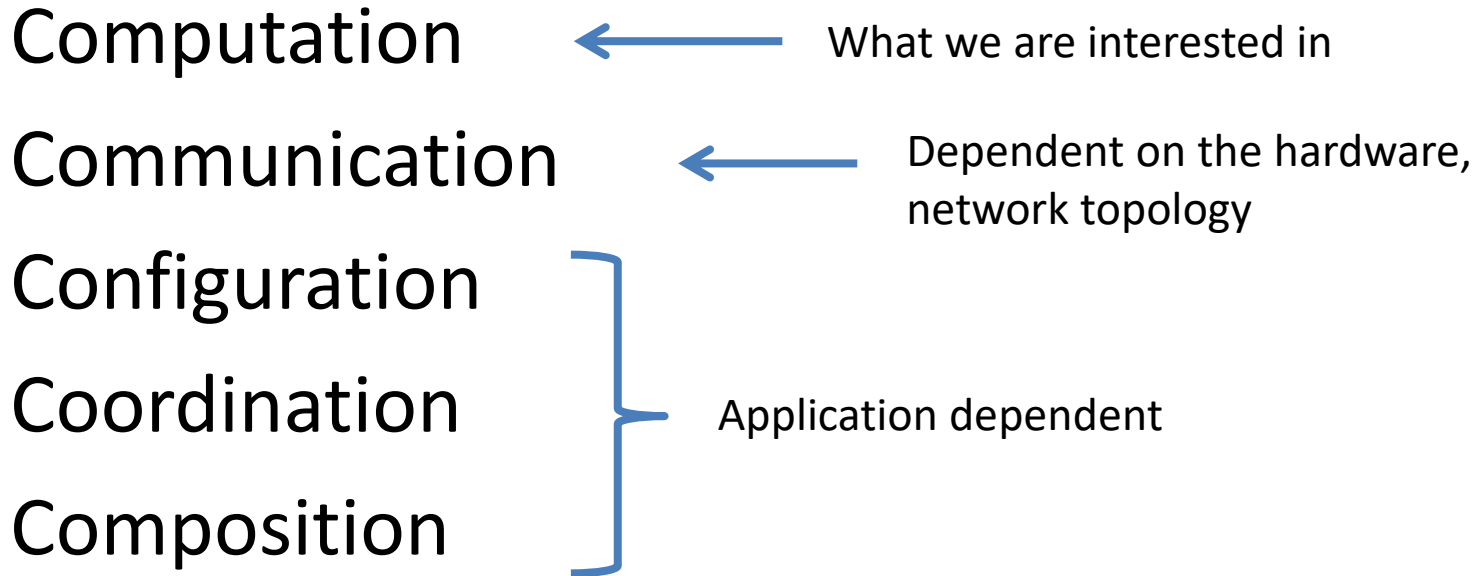

Fast **prototyping**

Lack of **standards**

Fluctuation in **hardware** and **algorithms**, lots of open questions

# Component driven software development

# YARP approach

- Simplified form of **publish-subscribe**
  - *Observer patter*: subscribers register their interest directly with publishers, which manage subscriptions and sends events
- Communication is **asynchronous** or synchronous
- Space decoupling
- Connections are **dynamic**
- Remote procedure calls for server-client type of communication

*See also:*

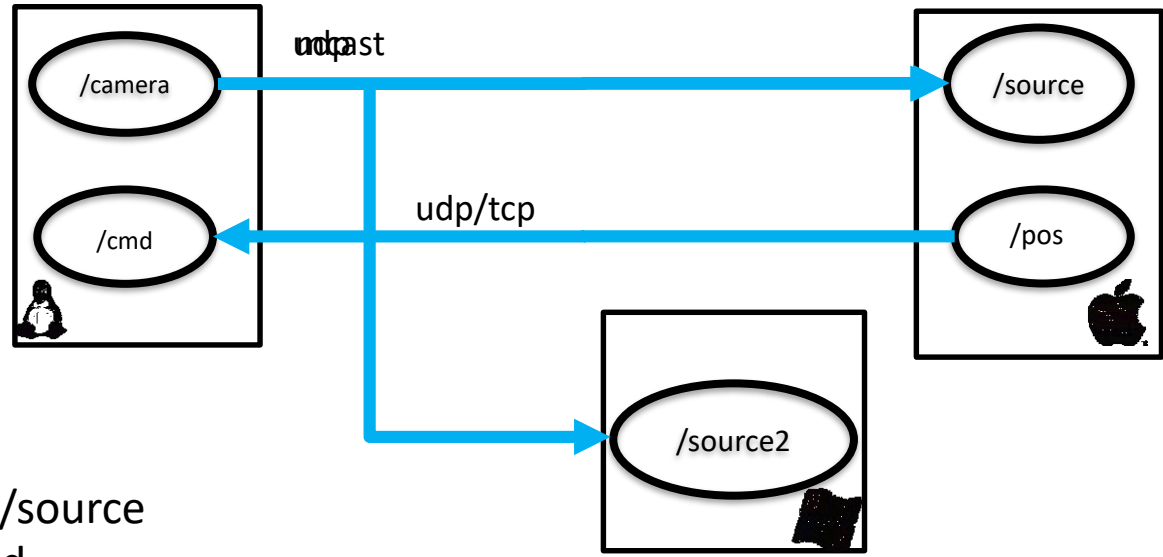

*YARP: Yet Another Robot Platform, G. Metta, P. Fitzpatrick, L. Natale, 2006*

*Design of Dynamically Reconfigurable Real-time Software Using Port-Based Objects, Stewart et al., 1997*

Register /camera, 192.168.1.4:10001  
Register /cmd, 192.168.1.4:10002  
Query /camera ...  
Query /cmd ...

Register /source, 192.168.1.3:10001  
Register /pos, 192.168.1.3:10002  
Query /camera ...  
Query /cmd ...

connect /camera /source  
connect /pos /cmd  
connect /camera /source2 mcast

# Which Middleware

- Robot Operating System (ROS)
- YARP
- OROCOS
- SmartSoft
- CORBA
- ICE
- OMG DDS
- Many others: OpenRDK, Mira...

# YARP/ROS comparison

## YARP

**Run-time reconfiguration** of connections

**Pluggable protocols** and **devices**

**Multicast** for efficient one-to-many communication

**Multi-platform**

**QoS, channel prioritization**

LGPL/GPL

Smaller community

No packet management

## ROS

Strongly **typed**

Rich set of **libraries** and **tools**

**Eco-system**, very active community

**Packet management**

BSD license

Ubuntu based

Restricted set of protocols

All connections from a topic use the same protocol

# YARP main features

- Peer-to-peer, **loosely coupled**, communication
- Stable code base >10 years old
- Written in **C++**, bindings for **python, Java, Matlab** etc..
- Easy install with **binaries** on many OSes/distributions (Ubuntu, Debian, Windows, MacOS)
- Recently added: **channel prioritization** (including QoS)
- Custom **protocols**:
  - Built-in: tcp/udp/mcast
  - Plug-ins: ROS tcp, xml rpc, mjpg etc..

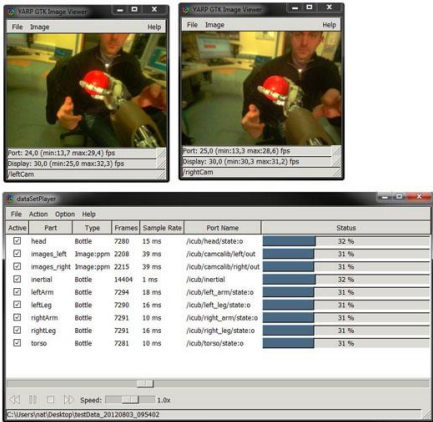

**CMake**  
Cross-platform Make

# Simulators and datasets

- Using YARP without hardware: [dataset player](#), [simulators](#)
- Available in [sources](#) and [binary](#) releases for Linux and Windows
- URDF models for iCub, Coman, Armar III, Walkman
- Gazebo (<https://github.com/robotology/gazebo-yarp-plugins>)
- Robotran (symbolic engine)

# Repositories

# Managing repositories & build system

- Projects are managed at the level of **individual repositories** and **large builds** (i.e. project repositories)
- Repositories are hosted on Github and on our own GitLab installation
- Single build system (YCM):
  - Agglomerate several projects in larger builds
  - Favor sharing of code (as opposed to binaries)
  - Built on top of CMake (~20 patches contributed to CMake)

lib-ace  
libxml2-dev  
libeigen3-dev

# Testing

- Unit testing for the YARP middleware on compile farm and github (travis)
- Pull Requests are peer-reviewed using CodeReviewHub
- Robot software is tested using Robotic Testing Framework
  - Specifications
  - Individual components
  - Configuration
  - Bugs

# Managing and building

The screenshot displays the YARP module manager interface. On the left, the 'Entities' tree shows a hierarchy of 'Application' and 'Modules'. The 'Application' folder contains 'EyesViewer-Localhost', 'FakeEyes', 'New-application', 'yarpdatadumper\_recording\_exam...', and 'yarpdataplayer\_example'. The 'Modules' folder contains various modules like 'depth2kin', 'iCub\_SIM', 'imuFilter', 'lumaChroma', 'motionCUT', 'opencv\_grabber', 'test\_grabber', 'yarp read /reader.i', 'yarp read /sniff-rpci', 'yarp rpc', 'yarpmotorgui', 'yarpSCOPE', and 'yarpview'. The 'New-application' folder is selected.

The central 'YARP Builder' window shows a diagram with 'iCub\_SIM' on the left and several modules on the right. Red arrows indicate connections: 'iCub\_SIM' connects to 'motionCUT' (labeled 'udp'), 'yarpview' (labeled 'udp'), 'yarpview' (labeled 'udp'), and 'yarpSCOPE' (labeled 'mcast'). 'motionCUT' also connects to 'yarpview' (labeled 'udp').

The right panel shows the 'Module Properties' for 'yarpview'. The 'Node' is set to 'localhost'. The 'Prefix' is '/New-application:yarpview:1'. The 'Deployer' is 'local'. The 'Parameters' section lists various parameters with dropdown menus.

Property	Value
Name	yarpview
Node	localhost
Stdio	
Workdir	
Prefix	/New-application:yarpview:1
Deployer	local
Parameters	
x	
y	
w	
h	
p	
neto	
neti	
out	
synch	off
compact	off
keep-above	off

At the bottom, a red error message states: '[ERR] (New-application) cannot connect /icubSim/left\_arm/state:o to /New-application:yarpSCOPE:1/yarpSCOPE'. Below it, a green message states: '[MSG] 5 applications are loaded successfully.'

# Managing and building

The screenshot displays the YARP module manager interface. On the left, a tree view shows the 'Entities' section with 'Application' and 'Modules' expanded. The 'Application' section includes 'EyesViewer-Localhost', 'FakeEyes', 'New-application', 'yarpdatadumper\_recording\_exam...', and 'yarpdataplayer\_example'. The 'Modules' section includes 'depth2kin', 'iCub\_SIM', 'imuFilter', 'lumaChroma', 'motionCUT', 'opencv\_grabber', 'test\_grabber', 'yarp\_read/readeri', 'yarp\_read/sniff-rpci', 'yarp\_rpc', 'yarpmotorgui', 'yarpSCOPE', 'yarpview', 'Resources', and 'Templates'. The main workspace shows a 'New-application' window with a 'YARP Builder' diagram. The diagram illustrates a network topology where 'iCub\_SIM' is connected to 'motionCUT' via 'udp', and 'iCub\_SIM' is connected to three 'yarpview' instances and one 'yarpSCOPE' instance via 'udp' and 'mcast'. Below the diagram is a table of connections:

Connection	ID	Status	From	To	Resource	ID	Type	Status
Internal	0	disconnected	/iCubSim/cam/left	/New-application:m	localhost	0	computer	available
Internal	1	disconnected	/iCubSim/cam/right	/New-application:ya				
Internal	2	disconnected	/iCubSim/cam/left	/New-application:ya				
Internal	3	disconnected	/iCubSim/left_arm/state.o	/New-application:ya				
Internal	4	disconnected	/New-application:motionCUT:1/motionCUT/img.o	/New-application:ya				

At the bottom, a log window shows error messages:

```
[ERR] (New-application) cannot connect /iCubSim/cam/left to /New-application:yarpview:1/yarpview/img.i  
[ERR] (New-application) cannot connect /iCubSim/left_arm/state.o to /New-application:yarpSCOPE:1/yarpSCOPE  
[ERR] (New-application) cannot connect /New-application:motionCUT:1/motionCUT/img.o to /New-application:yarpview:3/yarpview/img.i
```

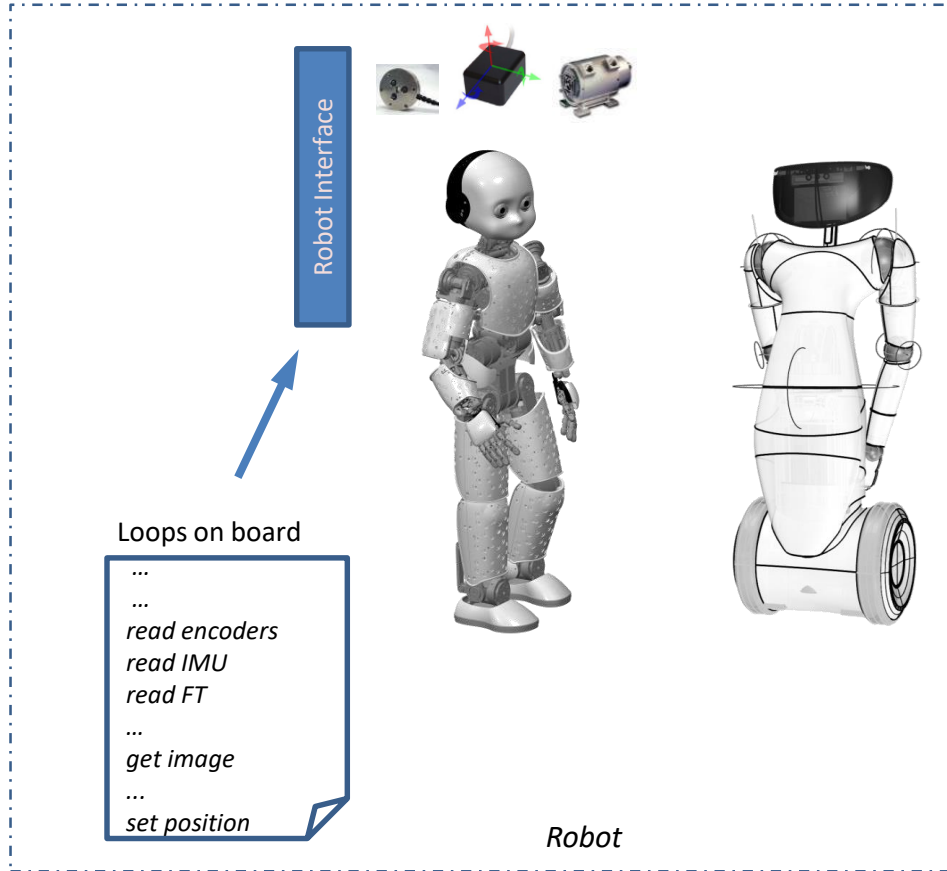

# Interfaces

- Robot abstraction layer: interfaces to **motors** and **sensors** minimize the impact of changes in the hardware
- Custom interfaces and data types (**Thrift IDL**)

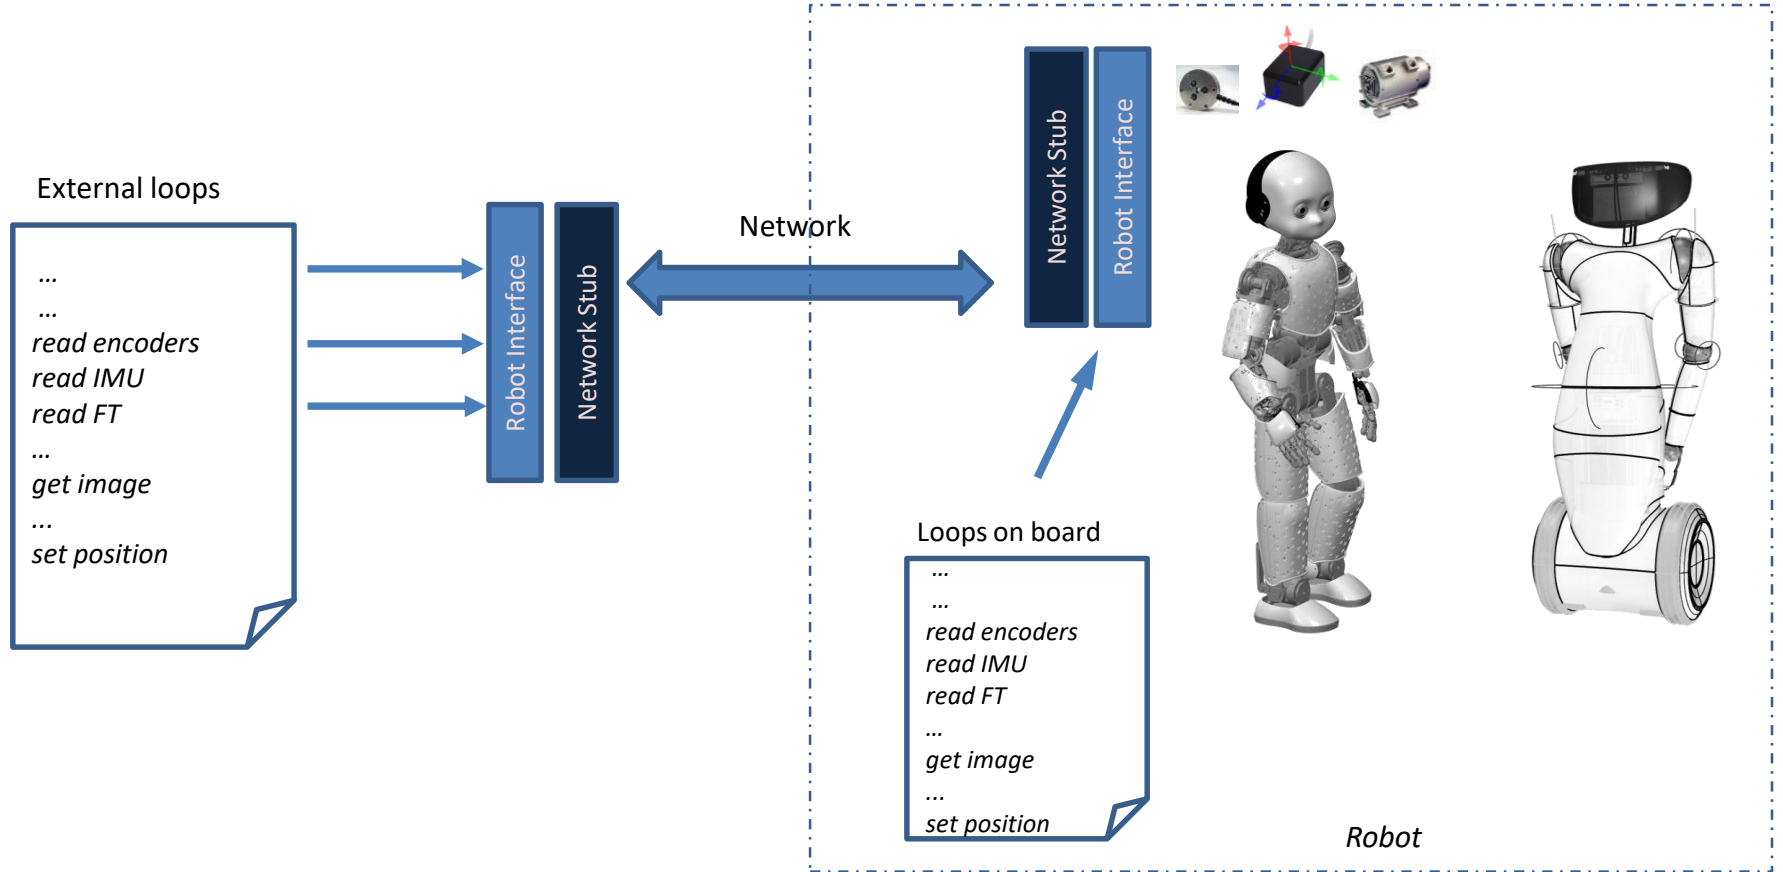

```
point3d.thrift
struct Point3D {
    1: i32 x;
    2: i32 y;
    3: i32 z;
}
```

```
adder.thrift
service Adder {
    /** ... */
    i32 get_answer();
    /** ... */
    bool set_answer(1:i32 val)
    /** ... */
    i32 add (1:i32 x);
}
```

# Robot Interfaces

# Robot Interfaces

# YARP plugins

- YARP includes a plugin system for [drivers](#) and [protocols](#) (carriers)
- Interchangeable carriers allow:
  - interfacing existing software with ports (without bridges)
  - change significantly port behavior
- Examples: [ROS](#), [mjpeg](#), xml rpc, ..., [port monitor](#)

# Carrier plugins

**yarp connect /camera /receiver**

**yarp connect /65.52.88.202:5159 /receiver mjpeg**

**yarp connect /image@/camera /receiver**

# More on YARP-ROS (1)

- YARP protocols for [rostcp](#) and [xmlrpc](#)
- Compatibility with [roscore](#)
- YARP [can interpret ROS messages](#), statically or dynamically
- Extended YARP's API ([nodes](#), [publishers](#), [subscribers](#))

```
#include "Pose.h"
#include "Twist.h"
/* create ROS Node /controller */
yarp::os::Node node("/controller");
/* create a subscriber for Pose.msg */
yarp::os::Subscriber<Pose> pose;
/* subscribe to /turtle1/pose */
pose.topic("/turtle1/pose");
/* create a publisher for Twist.msg */
yarp::os::Publisher<Twist> cmd;
/* publish to /turtle1/cmd_vel */
cmd.topic("/turtle1/cmd_vel");

/* read a new value from the topic */
pose.read(p);
/* publish the command */
cmd.write(t);
```

```
[type] BEGIN turtlesim/Pose
[type] float32 x
[type] float32 y
[type] float32 theta
[type] float32 linear_velocity
[type] float32 angular_velocity
[type] END turtlesim/Pose
```

Coman

**LA TESTA**

- 1 accelerometro
- 2 telecamere per visione «stereoa»
- 1 scanner laser rotante

1 pc per visione e percezione

1 struttura tubulare di protezione

---

**IL BUSTO**

Ruotabile di 180 gradi

- 1 zaino per alloggiare batteria
- 1 batteria 2kwh
- 1 pc per camminata e manipolazione
- 2 sensori coppie-forze (per controllare il movimento degli arti)

---

**LE BRACCIA**

Braccia retrovertibili e mani Soft-Hand (permettono di compiere atti molto precisi come spalmare il burro sul pane)

---

**IL BACINO**

- 1 accelerometro (IMU)
- 2 sensori coppie-forza

Attuatori nella parte alta per ridurre l'inerzia nella camminata

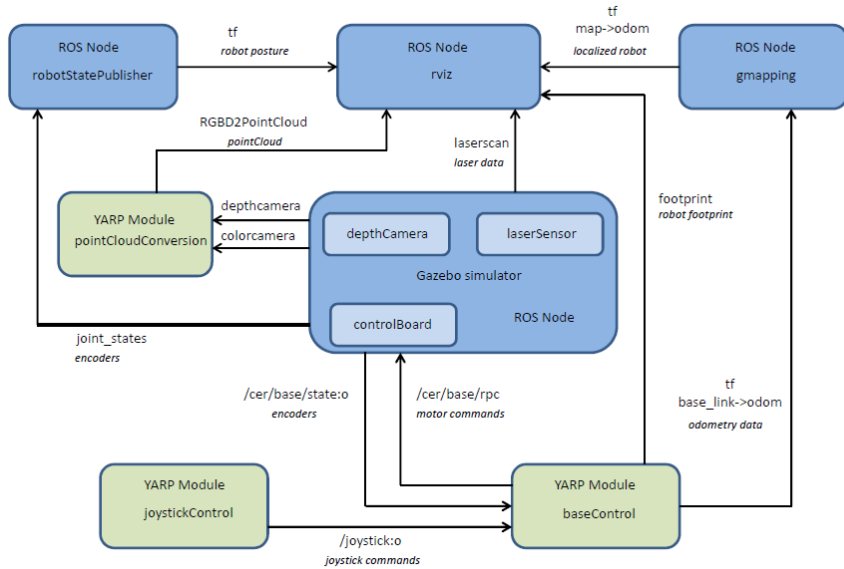

---

**LE GAMBE**

Piedi «compliant» (per adattarsi a superfici con diverse inclinazioni)

# Port monitor

# Why Channel Prioritization (QoS)

# Channel prioritization

Determinism is affected by:

- **Thread scheduling** (CPU usage)
- **Packet conflicts** (network usage)

Approach: improve determinism by **increasing thread priorities** and reducing network bottlenecks using **QoS**

```
> prop sched policy 1 priority 30  
> prop set qos priority HIGH
```

Standard YARP (20%)

With priority (20%)

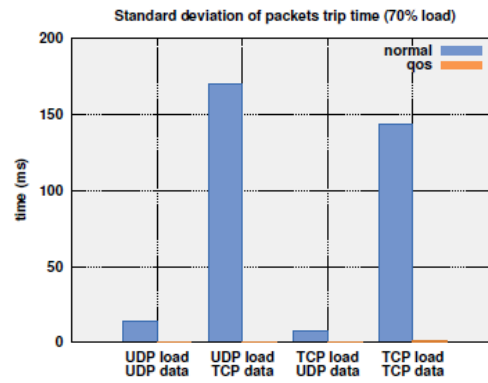

Standard YARP (70%)

With priority (70%)
